

CAKE Security Overview

Thoth Software LLC — Caleb Beers, Founder **Prepared for:** AmeriWater IT Review **Date:** May 2026

What CAKE Is

CAKE is a document Q&A system. Your team uploads PDF manuals, CAKE indexes them, and your technicians ask questions and get answers with citations back to the source material.

Where Your Data Goes

Your team uploads documents through CAKE's web interface. Thoth Software does not access your network — no VPN, no drive mounts, no admin credentials. You push to us; we don't pull.

During upload, document text is sent to the OpenAI Embeddings API to generate searchable representations, then stored in CAKE's search index. When a user asks a question, the question and relevant passages are sent to OpenAI's API to generate an answer. All transmission is over HTTPS/TLS. Original PDF files are not retained after processing.

CAKE is single-tenant. Your data is isolated in its own database and search index. No other customer can query against it.

AI Provider Security — The Copilot Comparison

CAKE uses the OpenAI API (the enterprise tier, not consumer ChatGPT). OpenAI's API policy: inputs and outputs are not used to train models, are not stored beyond a 30-day abuse-monitoring window (opt-out available), and are not accessible to other customers. This is the same API tier that powers Microsoft Copilot. If your organization has already approved Copilot or Microsoft 365, you have already approved this security model.

Infrastructure

CAKE runs on Fly.io (US data centers, SOC 2 Type II certified). Three components: a Phoenix web application, PostgreSQL database, and OpenSearch index — all encrypted at rest and in transit. OpenAI's API is SOC 2 Type II certified independently.

Vendor Policies

Contract termination: All stored data exported in standard format and permanently deleted within 30 days. Your original documents are always yours.

Certifications: Thoth Software is pre-SOC 2. Compensating controls: single-tenant architecture, encryption in transit and at rest, and all infrastructure dependencies (Fly.io, OpenAI) are

independently SOC 2 certified.
